

Hat-trick for SA steel merchants

Pro Roof has recently completed its third building for Renico Construction.

The three buildings have a combined total roof area of 34 500m² Pro Lok 700, 0,55mm-thick concealed fix roofing and 20 000m²

Widespan 0,55mm-thick side cladding.

The buildings function as commercial warehousing space and industrial buildings with office space.

Pro Lok 700 concealed fix roof sheeting was designed for low-pitch roofs with water-tightness and maximum water-carrying characteristics. Pro Roof Steel Merchants uses the highest quality local and international material to rollform.

Pro Lok 700 has been tested by the South African Bureau for Standards (SABS) and conforms to SANS 10400, and has proven itself as a reliable, strong and water-tight system that is easy to install and maintain.

Apart from a quick inspection quarterly and after severe storms, the only maintenance required on the product is to check for wind-driven foliage on the roof or blocking rainwater gutters.

Pro Lok 700 is water-tight, long-spanning, wide-covering and lightweight. Other impressive features include its deep ribbed texture, which allows for better water-carrying capacity, easy and quick installation, optimum wind-load resistance, spring curving, thermal expansion sliding and the fact that Pro Lok 700 can be cranked to a minimum radius of 500mm. Pro Lok can also be factory- or on-site bull-nosed or curved to specification.
